After an initial assessment, it may be necessary to see an endocrinologist, a rheumatologist, or another specialist to rule out the possibility of an underlying disease that may contribute to osteoporosis: Endocrinologists treat the endocrine system, which comprises the glands and hormones that help control the body's metabolic activity.

## **For People With Osteoporosis: How To Find a Doctor | NIH ...**

As your body grows into adulthood, it uses the minerals calcium and phosphate to form bones. When you get older, these minerals can be reabsorbed from the bones back into the body, causing the bones to weaken. This weakening can be caused by several things, including: In women, a drop in estrogen at the time of menopause

## **Osteoporosis | Endocrinology | Dartmouth-Hitchcock**

Without estrogen, osteoblasts can't produce enough new bone, and eventually, osteoclasts (bone-absorbing cells) overpower them. That's why post-menopausal women are at a high risk for osteoporosis. In men, testosterone protects bone. When testosterone levels drop, it can lead to bone loss. Medical Conditions.
